

ABSTRACT OF THE DISCLOSURE

An animal feeder includes a housing including a bottom wall and a
5 peripheral wall. A cover is removably positionable over an opening
defined by an upper edge of the peripheral wall for selectively opening or
closing the housing. Each of a pair of mounts is positioned on the
peripheral wall. A funnel is positioned in the housing and includes a
spout extending outwardly through the bottom wall. A plate has an upper
10 side that has a central area having a raised portion thereon. Each of a
plurality of rods has a first end attached to the bottom wall and a second
end attached to the plate such that the spout is vertically aligned with the
raised portion. A limb mounting assembly includes a pair of male couplers
for attaching to the mounts and a tether for selectively hanging the
15 housing.
